El Niño could leave 4 million people in Pacific without food or drinking water

Papua New Guinea drought has already claimed two dozen lives and looming El Niño weather pattern could be as severe as 1997-98, when 23,000 died globally

Children at Algi village in Papua New Guinea. PNG is in the midst of what could be its worst drought in close to 30 years. Photo: AARIC

As El Niño gets stronger Australia gets hotter, drier and more ready to burn

Bureau of Meteorology says prospect of drier-than-normal October is about 70% in southern Australia which comes after third-driest September on record

Will El Niño ‘solve’ drought? Not if the rain falls in Southern California

One region's weather win is another region's catastrophe

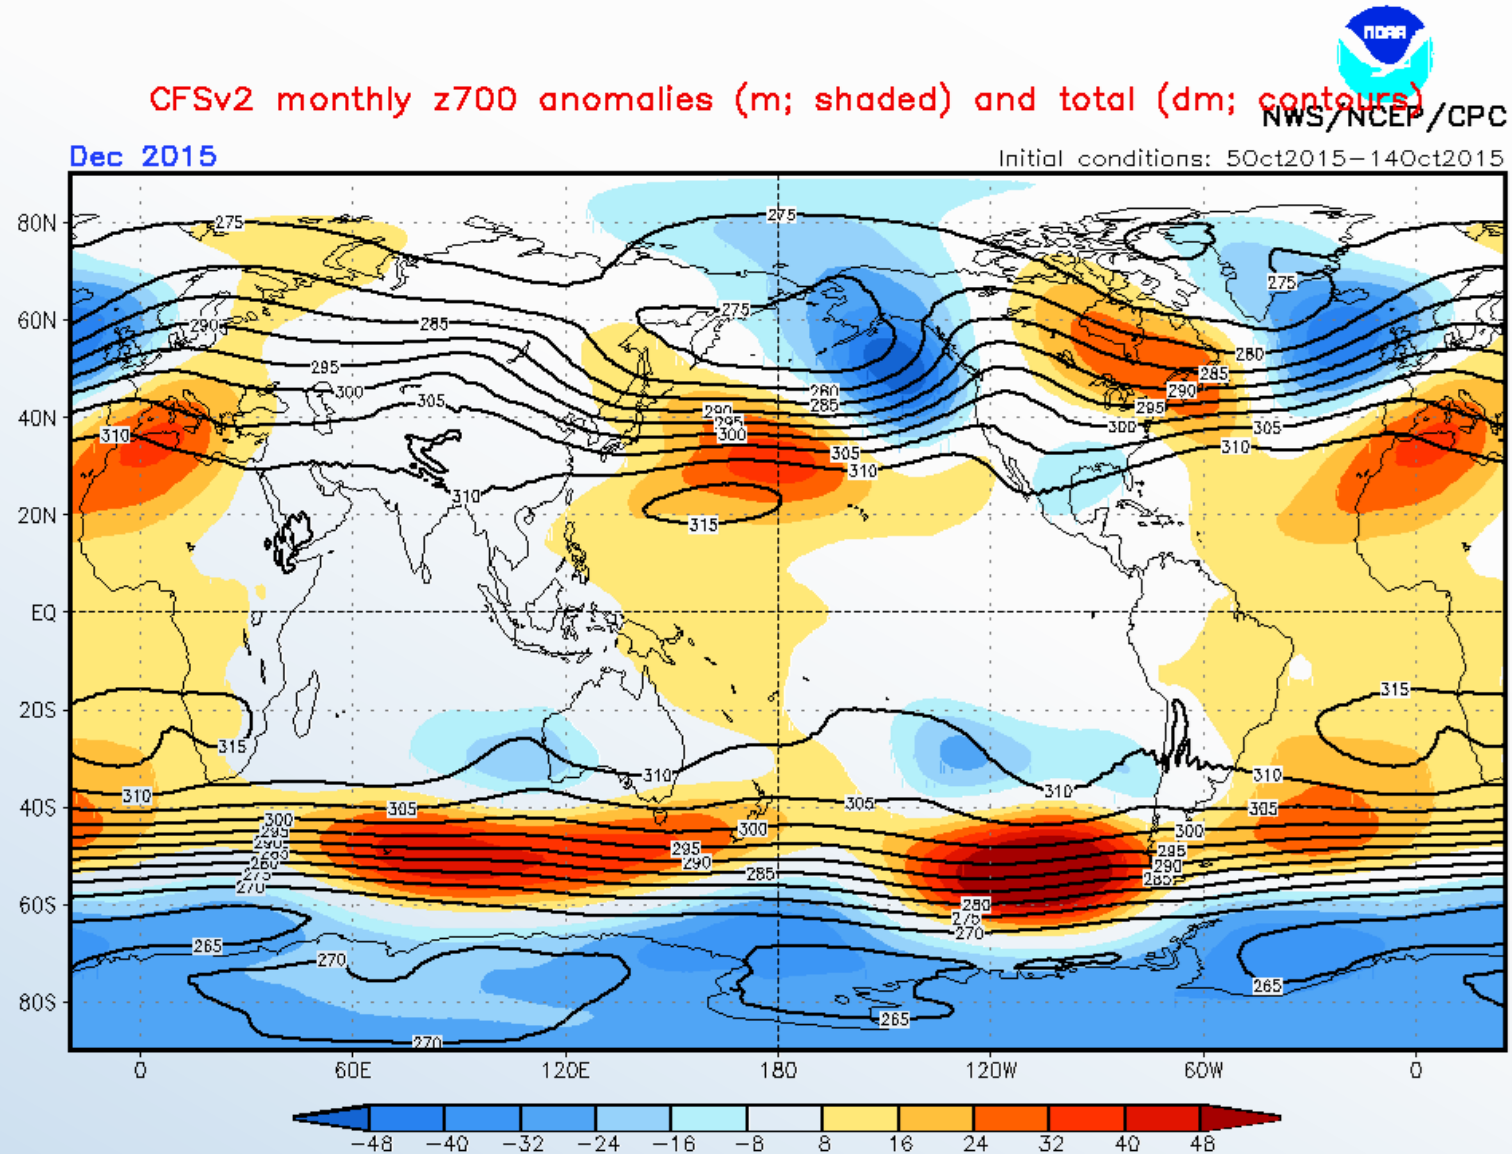

El Niño: Wet winter likely across California, not just in south, new report says

Dynamical vs. Statistical

Dynamical vs. Statistical

Correlation: Amman Nov rainfall and global Sea Level Pressure

Why use statistical methods?

- Performance
- Computational efficiency
- Local specificity
- Empirical foundation
- Ability to leverage independent datasets

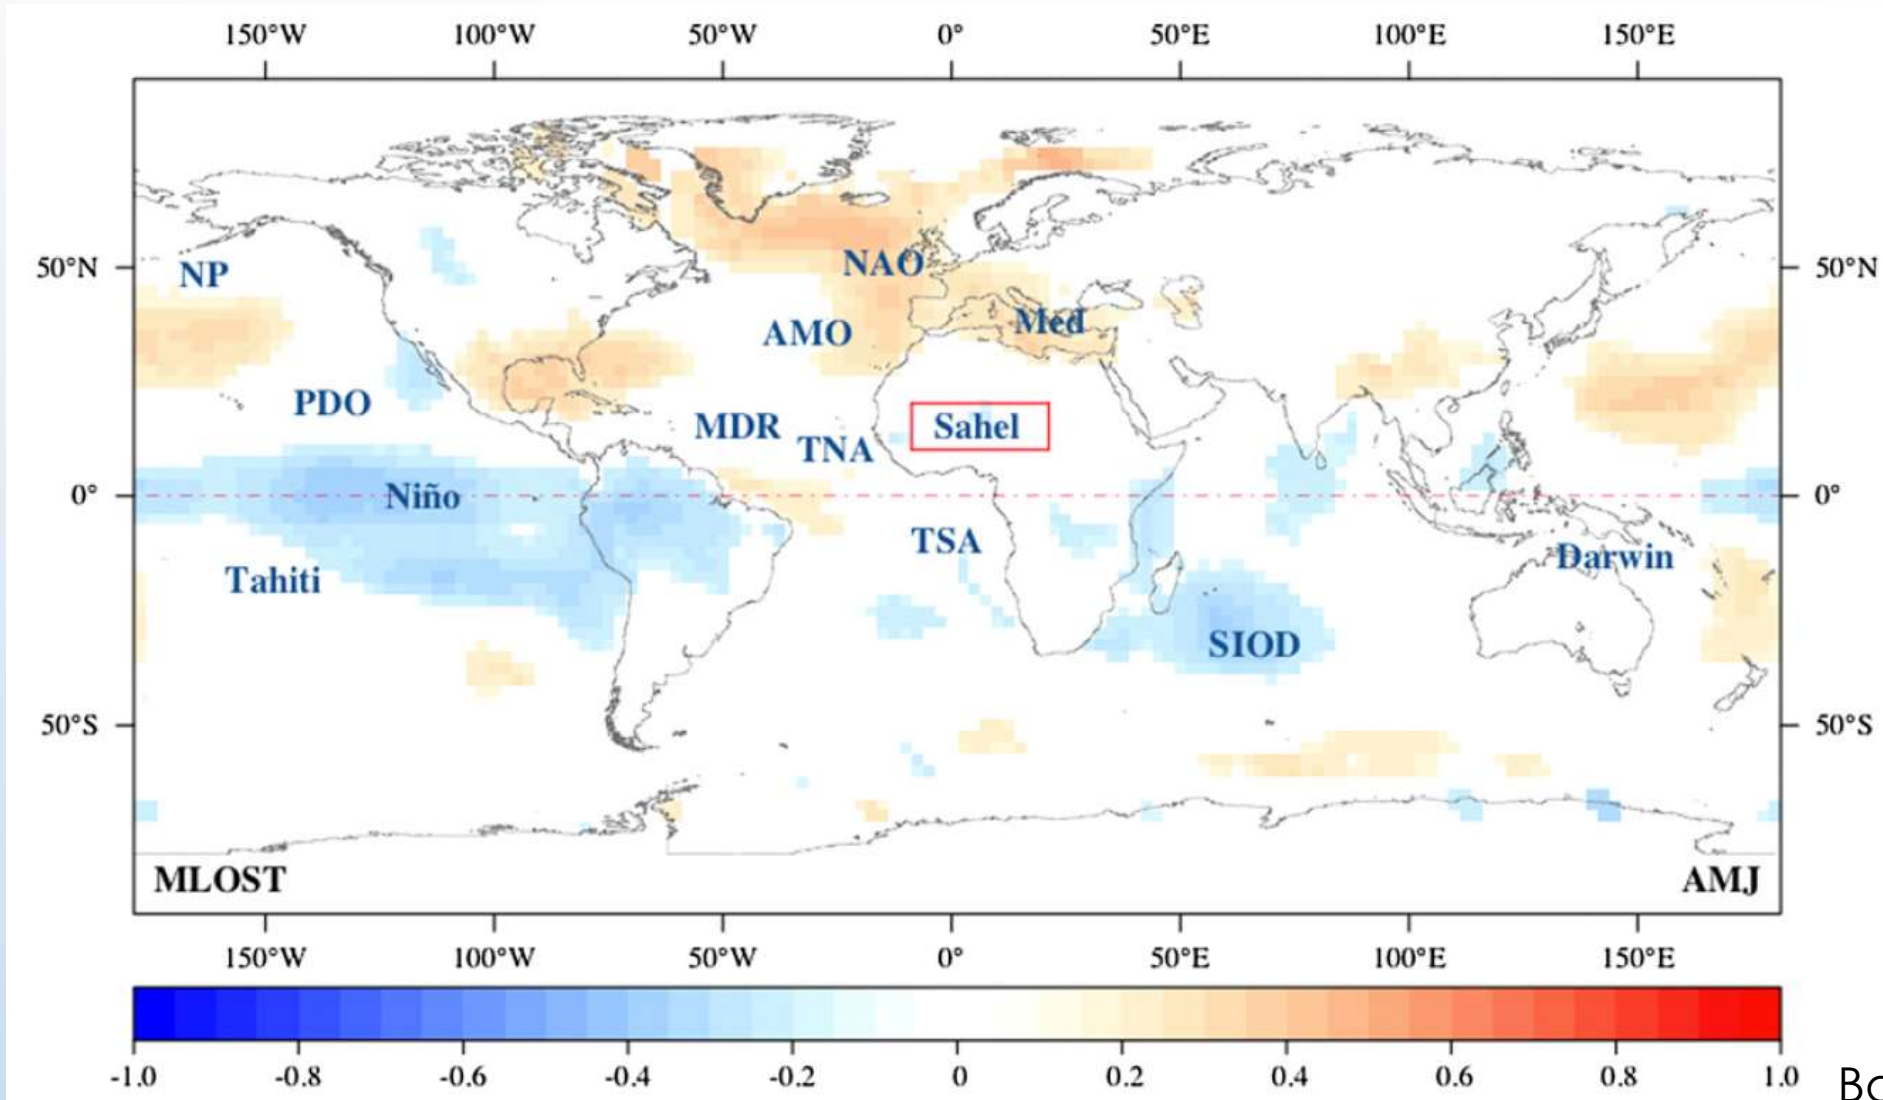

The Big Data Challenge

- Huge numbers of potential predictors
- Wide range of processing options
- Diverse analytic techniques

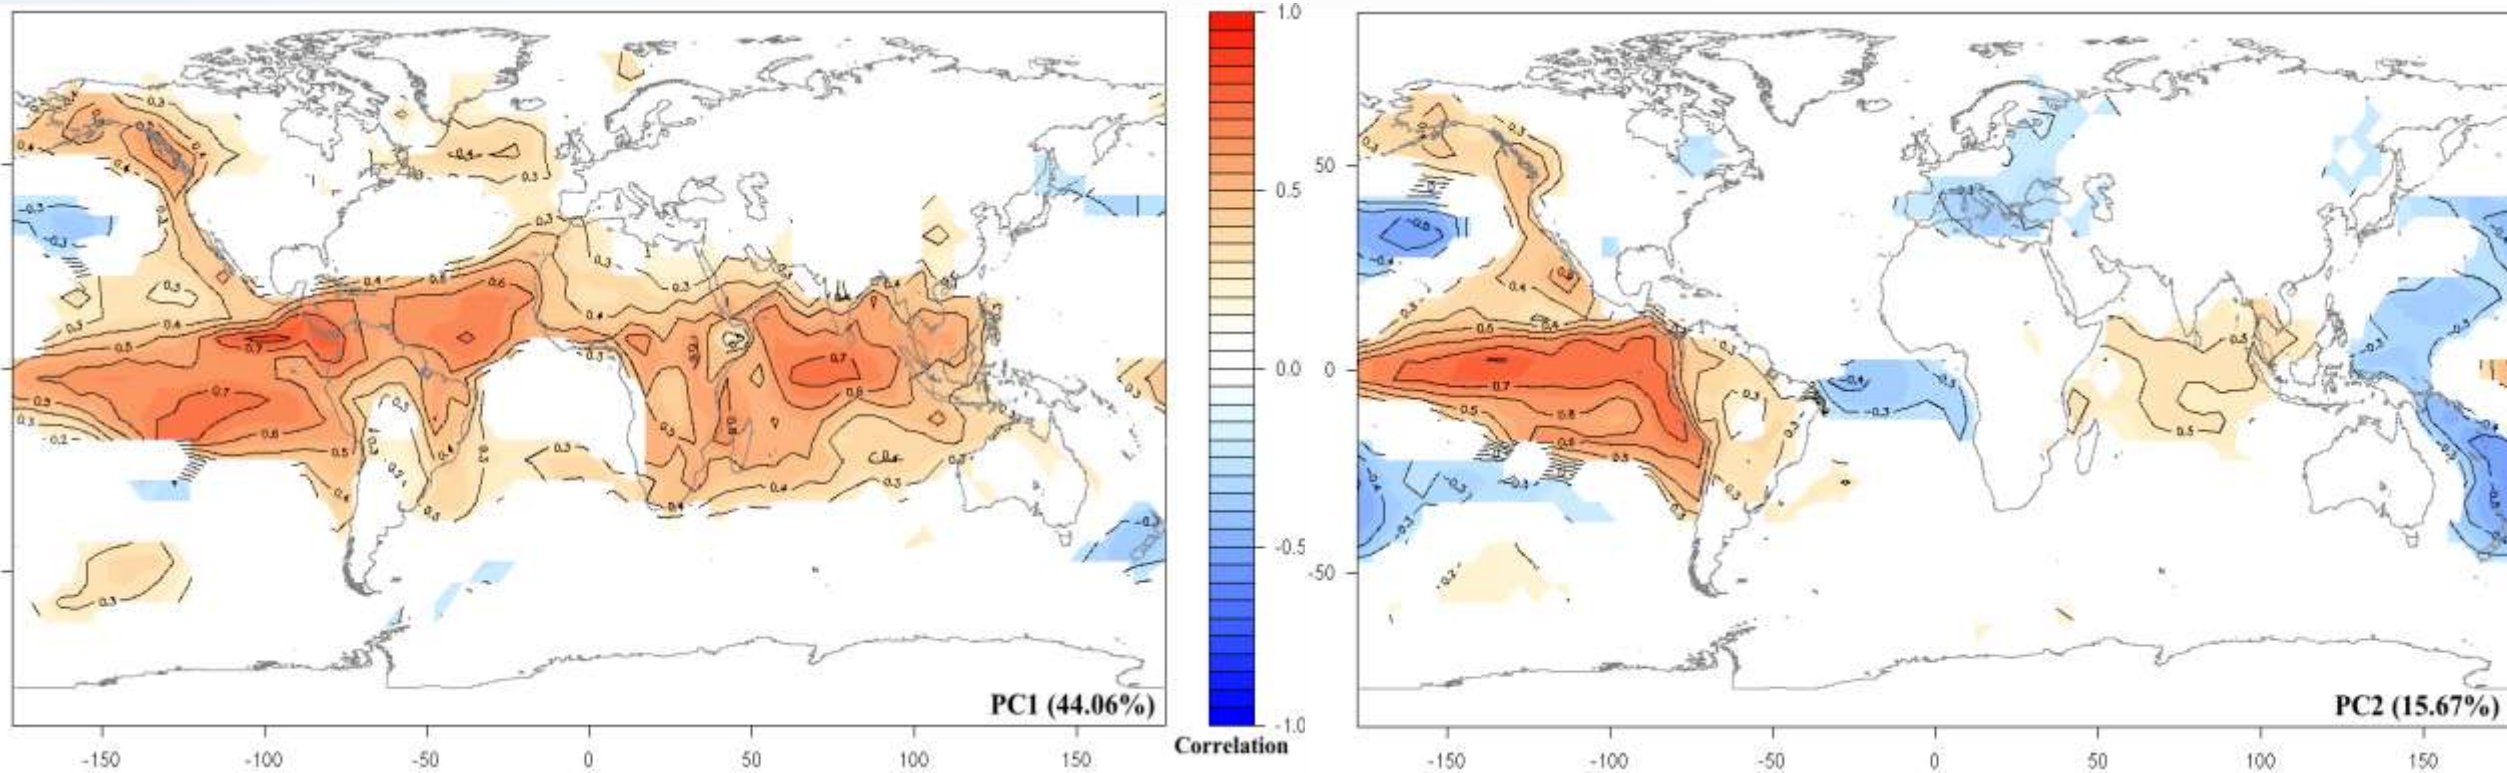

Our Goals:

- Create a system for optimizing statistical forecasts
- Create an online tool for generating optimized forecasts
- Automate variable selection across datasets

Optimizing Forecasts: The Sahel

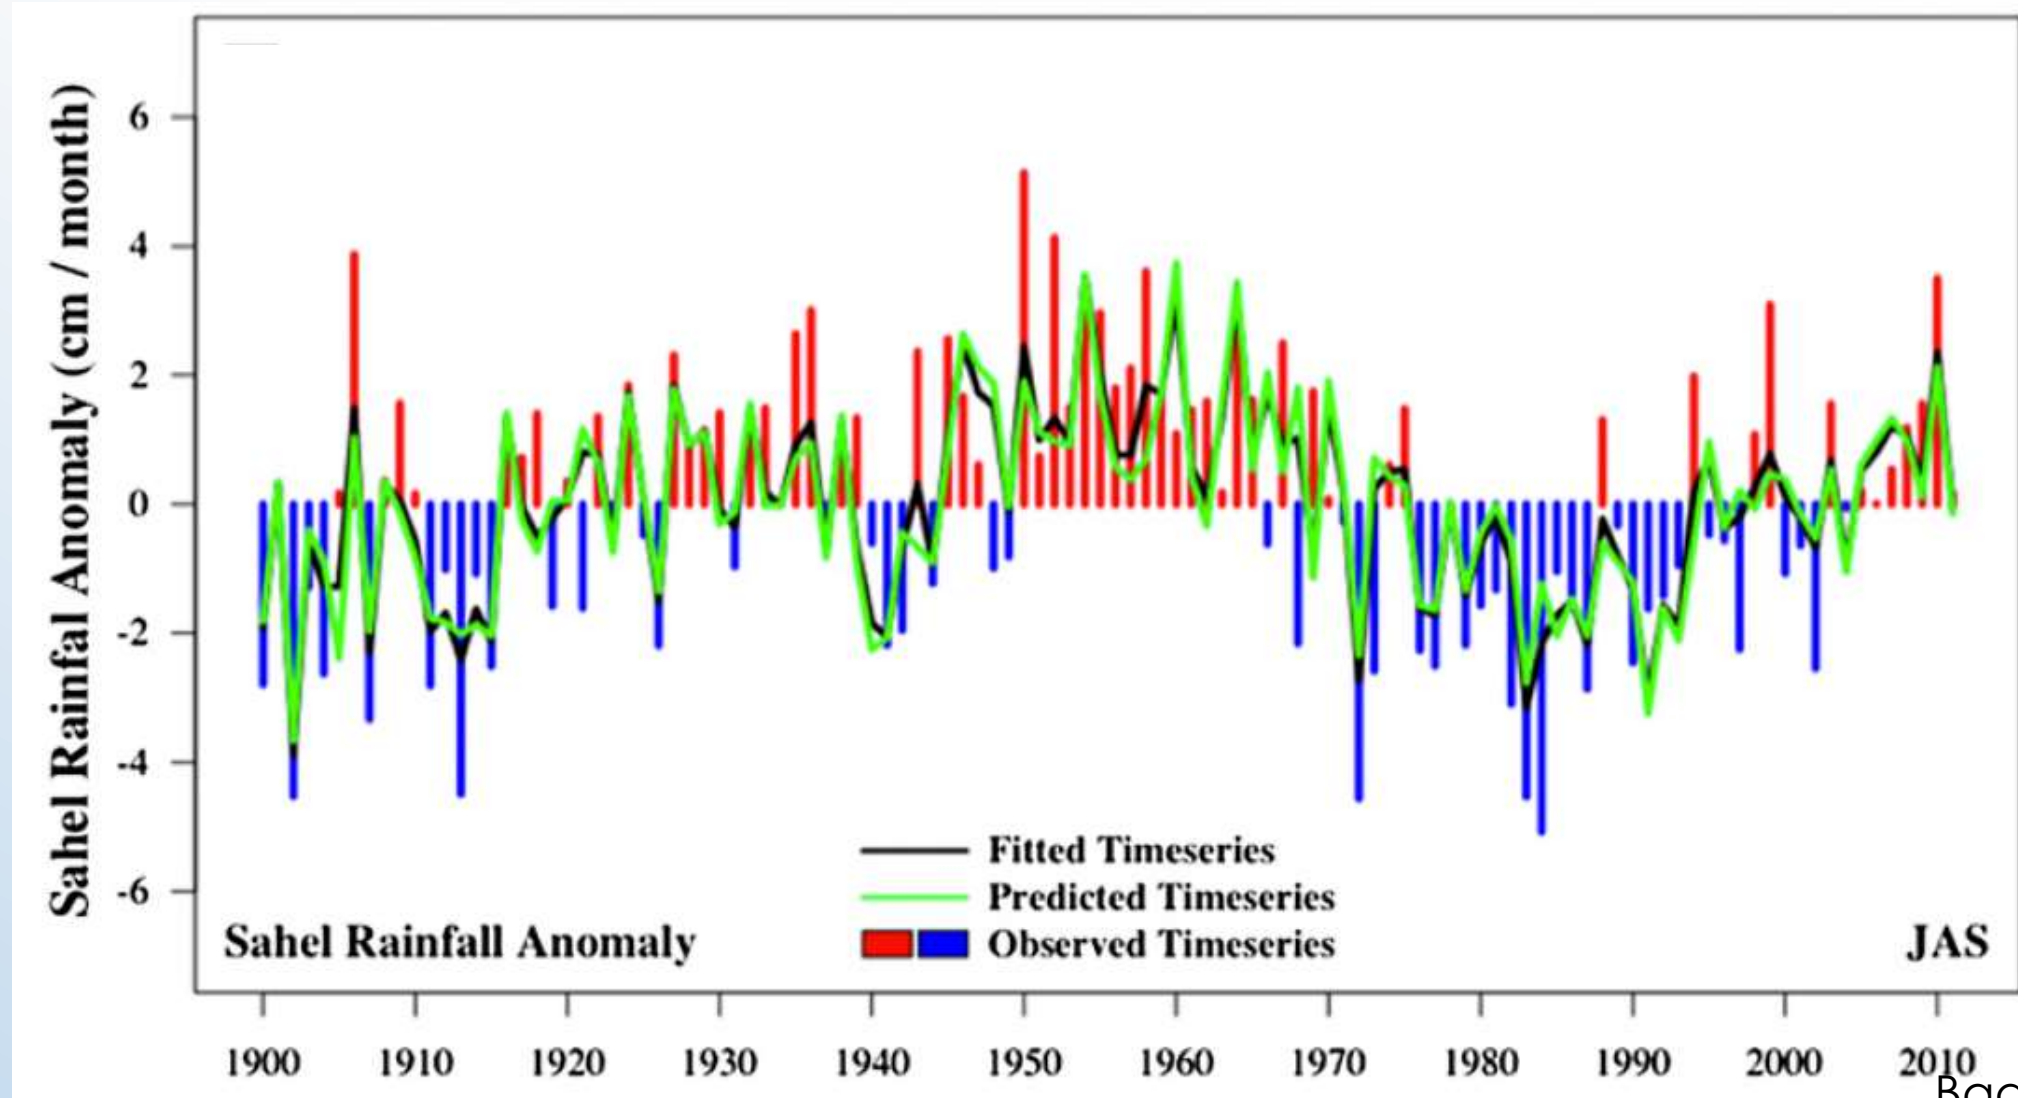

Optimizing Forecasts: The Sahel

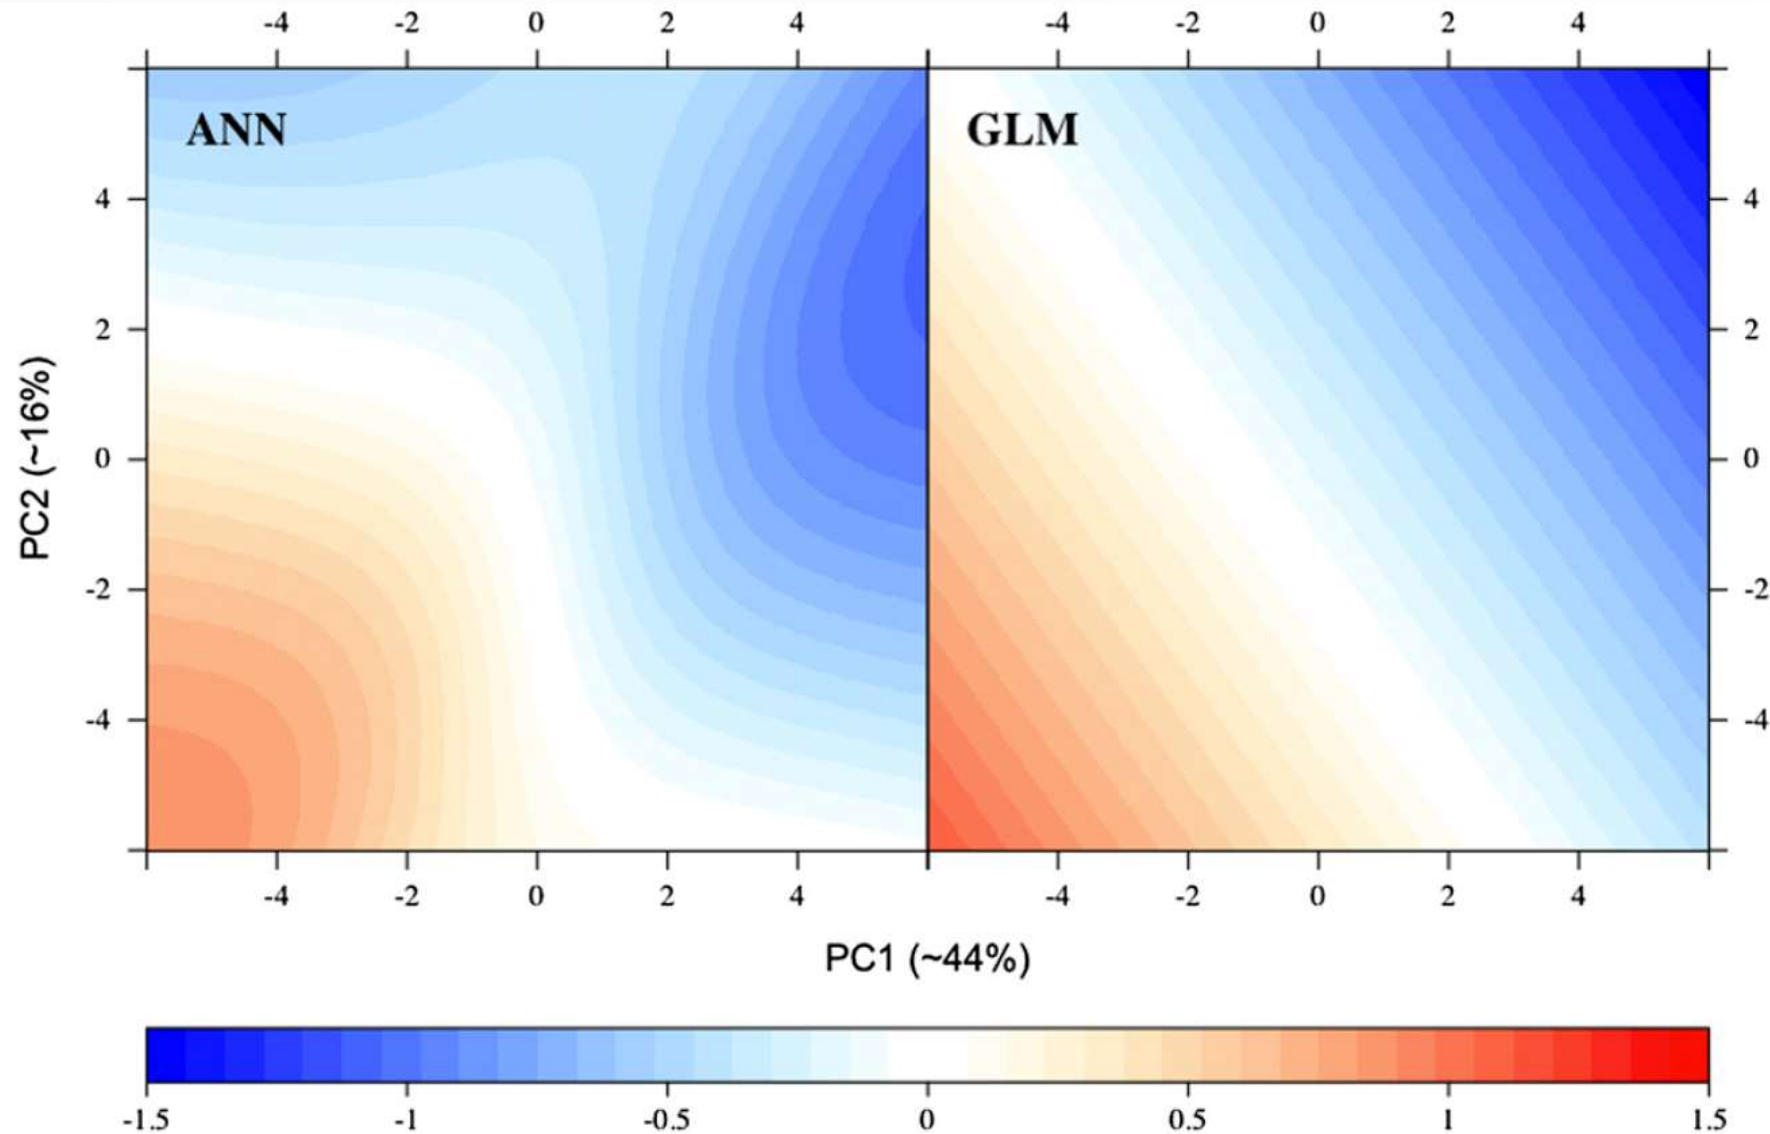

Optimizing Forecasts: The Sahel

Model	Description
GLM	Full-covariate generalized linear model
SGLM	Selected generalized linear model based on stepwise selection
GAM	Full-covariate generalized additive model
SGAM	Selected generalized additive model based on penalized terms
MARS	Multivariate adaptive regression spline
CART	Classification and regression trees model
BCART	Bagged classification and regression trees model
BART	Bayesian additive regression trees model
RF	Random forest model
ANN	Artificial neural network
Avg	Prediction is the mean of the predictions of all models
Null	Prediction is the mean of the response variable in the training data
Memory	Model using last year's rainfall as this year's prediction
